

Real-time systems

Does your organization rely on real-time data to monitor and steer processes? We help you to design and create systems that securely record and efficiently store, validate and analyze real-time data and derive added value from it.

Our solutions for processing and analyzing real-time data and near real-time data enable us to help you optimize how you monitor, forecast and manage your processes, systems and assets.

Our services include:

- Consulting and concepts for real-time systems and their use in business intelligence (BI) environments, asset management systems and management information systems
- Software development for processing real-time data from heterogeneous data sources
- Quality checks, plausibility checks and analysis of real-time data and data streams
- Visualization of real-time data in space and time using tools such as online dashboards

In implementation, we build on leading solutions from [Microsoft](#) and [Esri](#).
