

Integral Real Estate Security

The risks for real estate and technical infrastructures are constantly changing, requiring a constant examination of security issues. We meet these requirements with an integral approach to security, supporting our clients with risk-based planning services and cost-efficient measures that greatly increase the resilience of their real-estate properties and technical infrastructures.

Our integral approach takes in a comprehensive view of the following factors:

- The assets: building shell, content, persons, functions and sensitive data
- The spectrum of threats and hazards: from everyday events (vandalism) to warlike events (effects of weapons), natural hazards, technical events and human error
- Impact analysis: determining material value, information, functional and image loss
- Action planning: structural, technical, operational, organizational and legal measures

We have many years of experience in the following areas:

- Threat and hazard analysis for above-ground and underground infrastructure
- Quantitative risk analysis based on assessed functional and system values of individual objects
- Development of risk-based methods for testing the effectiveness and proportionality of measures
- Development of a testing methodology for audits and inspections on the security technology status
- Conducting audits and security reviews
- Providing technical expertise in the area of protection against the effects of weapons and the safe handling of ammunition and explosives
