

Asset Information Management Concept for Swissgrid

To reliably operate its power grid, Swissgrid requires comprehensive, accurate and up-to-date data on its assets. EBP has identified various ways of making existing data more easily accessible and maintain its quality in the long term. These include technical solutions such as a common data model and organizational adaptations. This concept forms a basis for the forward-looking optimization of Swissgrid's asset information management.

Our services

- Documenting the basics
- Drafting a concept with a situation analysis, target image and proposed measures
- Creating graphics to communicate the concept
